at the POS

 **ZUCCHETTI**

HIGHLIGHTS

-  No queues at the POS
-  1 or 2 large bagging areas
-  Customizable user interface
-  Accepts all payment types
-  User-friendly

Optimize processes through omni-functional technology, boosting your customer journey. By bundling Zucchetti's TCPOS software technology and PartnerTech self-checkouts, your supermarkets and your shops can provide an autonomous and more efficient customer experience, reducing queues at the POS and boosting revenues.

TCPOS innovative self-checkout software solution combines proven Zucchetti's POS technology with intuitive self-service for accepting payments in retail trade and catering. The small self-checkouts should reduce queues and contribute to a smooth shopping experience with a seamless checkout procedure.

A customized look can be created easily in the retailer's brand environment, which means that the retailer is free to design the UI as desired or adorn the self-service till with pictures of products and offers.

With its intuitive software, the cash register guides the customer through all steps of the process and provides different payment methods at the end. The self-service checkout supports a wide variety of cashless payment procedures, such as customer cards, debit cards or via smartphone.

The solution has built-in scales that perform the weighing process precisely, are intuitive to use, and ensure a convenient checkout process for customers.

The self-checkout system by Partner Tech Europe offers companies new possibilities for time and cost optimization. Customers can scan their products and pay for their

purchases quickly and easily at the self-checkout cash registers, greatly simplifying the company's internal personnel management.

But how does the PTES Self-Checkout system work? To avoid long waiting times at the tills, Partner Tech Europe offers a new solution: the self-checkout cash registers. In addition to the common cash registers, counters are set up at which customers can scan and pay for their purchases themselves. The self-checkout cash registers consist of a large screen, a scanner and a card payment device.

The customer scans the products and can see directly on the screen which items have been scanned and how much they cost. Once all items have been scanned, the customer can pay for the purchase by credit or debit card and insert coupons or vouchers into the slot provided for this purpose.

The purchase is now complete. The cash registers also have devices on both sides on which customers can place their shopping or their shopping bags. These cash registers are not only practical and easy to use, they also promote a modern appearance of the facility and cause a futuristic shopping experience.

TCPOS is designed to seamlessly work with Partner Tech Europe's self-checkout system, whose flagship hardware solution offers many advantages to supermarkets and shops. The new system reduces the usually high number of people at the cash desks, resulting in significantly shorter waiting times for customers during peak hours. A faster payment process leads to increased customer satisfaction.

Personnel costs are also reduced, since one employee can supervise several self-checkout registers at once.

Often only one single employee is needed to monitor five to eight cash registers at the same time and offer support to customers if necessary.

The main job of assigned is to check if the customers actually scan every single product and to make sure that the purchase is handled correctly. As a plus the cash registers can be customized in order to ideally meet the individual needs of a company. On top, this verified system offers maximum security and protection against fraud. The use of self-checkout cash registers has been proven to reduce problems and incidents during the payment process.
